技术规格

Background:	The neuropeptide galanin elicits a range of biological eff ects by interaction with specific G-protein-coupled recept ors. Galanin receptors are seven-transmembrane proteins shown to activate a variety of intracellular second-messe nger pathways. GALR1 inhibits adenylyl cyclase via a G p rotein of the Gi/Go family. GALR1 is widely expressed in the brain and spinal cord, as well as in peripheral sites s uch as the small intestine and heart.
