技术规格

Background:	Low affinity receptor for N-formyl-methionyl peptides, which are powerful neutrophil chemotactic factors. Binding of FMLP to the receptor causes activation of neutrophils. This response is mediated via a G-protein that activates a phosphatidylinositol-calcium second messenger system. The activation of LXA4R could result in an anti-inflammatory outcome counteracting the actions of proinflammatory signals such as LTB4
Applications:	ELISA, IHC
Name of antibody:	FPR2
Immunogen:	Synthetic peptide of human FPR2
Full name:	formyl peptide receptor 2
